AnyDesk Crack 5.4.0 With Serial Code 2020 Microsoft Windows Here is a very amazing software to.Q: How do I write an element's innerHtml using JavaScript from a string? So I am updating a portion of a web page like so: if(document.getElementById("navbar")){ var current = document.getElementById("navbar"); current.innerHTML = "Closing Out!"; } When I run this I get a "current.innerHTML is undefined" error. I know for sure that the element I am querying for exists because the if statement works in all other cases when I do the same thing. Do you know why I might be getting this error? I have attempted to change it to eval("current.innerHTML") as well. I am stuck and at a loss. Any help is greatly appreciated. Thanks in advance. A: The getElementById's return a HTML element, not an object that has innerHTML. You can use jQuery instead : if (\$("#navbar").length > 0) { \$("#navbar").html("Closing Out!"); } Using plain js, you can get an instance of the element and then update its innerHTML : if (document.getElementById("navbar")) { var current = document.getElementById("navbar"); current.innerHTML = "Closing Out!"; } EDIT : And if you want to use your current variable, you need to do something like this : if (document.getElementById("navbar")) { if (document.getElementById("navbar")) { var current = document.getElementById("navbar"); current.innerHTML = "Closing Out!"; } } is above the knee”? Well, if you look at the length of the leg, it doesn’t seem to be. But it’s because your eye’s focus is below the knee. “Loose sand” isn’t a problem, if you look for the problem. I get to where I want to go, once I’ve learned my lesson about the “loose sand” ... “If f678ea9f9e
