gsmjv? I saw a proof of concept on my work, that I have also seen it on my girlfriend's computer, that showed the autocad version 2008 (tested on the last version of Windows (x64)) has been using in the past few weeks, without no explicit indication. I suppose that the software has been sent by an infected USB keygen from another computer (or the cyber cybercrime), could be easier to detect all the autocad keygen that was used and send it to a keylogger / remote tracking, is there anyway to know if it was autocad 2008 or not? A: This website does a pretty good job of finding such files, and showing you if it is a legitimate copy or not. See if this is a potentially illegitimate copy (which looks like it). If you're lucky, and your girlfriend isn't a vengeful sociopath, you may have something that's a legitimate copy of an legitimately downloaded file. Q: Getting the nth subgroup from a group using jq Consider the following JSON data, that consists of groups of keys in an array. Each group has an integer key that is the number of subgroups. In this example, I have four groups. A command, using jq, can return the subgroup number of interest. [ { "group": [ { "key": 1, "value": "some value" }, { "key": 2, "value": "some other value" }, { "key": 3, "value": "82157476af" } ] }
